### **Blood Pressure Changes in Relation to Arsenic Exposure in a U.S. Pregnancy Cohort**

Shohreh F. Farzan, Yu Chen, Fen Wu, Jieying Jiang, Mengling Liu, Emily Baker, Susan A.  
Korrick, and Margaret R. Karagas

**Table S1.** Mean blood pressure by gestational week.

**Figure S1.** Graphical representation of relationship between maternal urinary arsenic at gestational week 24-28 (x-axis) and systolic blood pressure at the end of pregnancy (average of last three measurements during pregnancy) (y-axis), as estimated by linear regression. The solid line represents the linear regression equation, when covariates are set equal to the median values in the regression equation (age at enrollment: 30.96 years, pre-pregnancy BMI: 24.02 kg/m<sup>2</sup>, educational level (completed college), marital status (married), maternal smoking (no), parity (1 child), and gestational diabetes (no)); the dotted lines represent the 95% confidence interval.
